Tumor necrosis factor-alpha gene expression and protein production in the chorioallantoic membrane of chicken embryos. Chicken chorioallantoic membrane (CAM) is a readily available source of secretory cells which can be transfected with recombinant vectors in order to study gene expression and protein secretion in vitro. In this study we evaluate the expression of the tumor necrosis factor-alpha (TNF-alpha) gene in CAM during chicken embryo development and the effectiveness of different transfection protocols. First, the concentration of TNF-alpha in the culture medium and in tissues of embryos (CAM, liver and brain) was measured by using a specific enzyme-linked immunosorbent assay. Second, the expression of the TNF-alpha gene in CAM was evaluated by RT-PCR and by in situ hybridization with a digoxigenin-labeled RNA probe. Finally, several transfection protocols were studied in order to optimize the efficiency of the transfer of the TNF-alpha gene in CAM. These protocols included the use of three different promoters, the inclusion of the serum response element (SRE), and the use of different amounts of liposomes. The TNF-alpha mRNA expression was demonstrated by RT-PCR both in CAM and in liver, and TNF-alpha protein expression was demonstrated in CAM only by immunohistochemistry. With the aid of different transfection protocols, the highest transfection efficiency was obtained with a liposome mixture containing DNA and TransFast. In a statement Wednesday, the U.S. Attorney's office in Washington said it was still reviewing the case and declined to comment on the specifics of it. "Following his
